SAFETY NOTICE

This documentation is only intended for qualified technicians who are aware of the respective safety regulations.

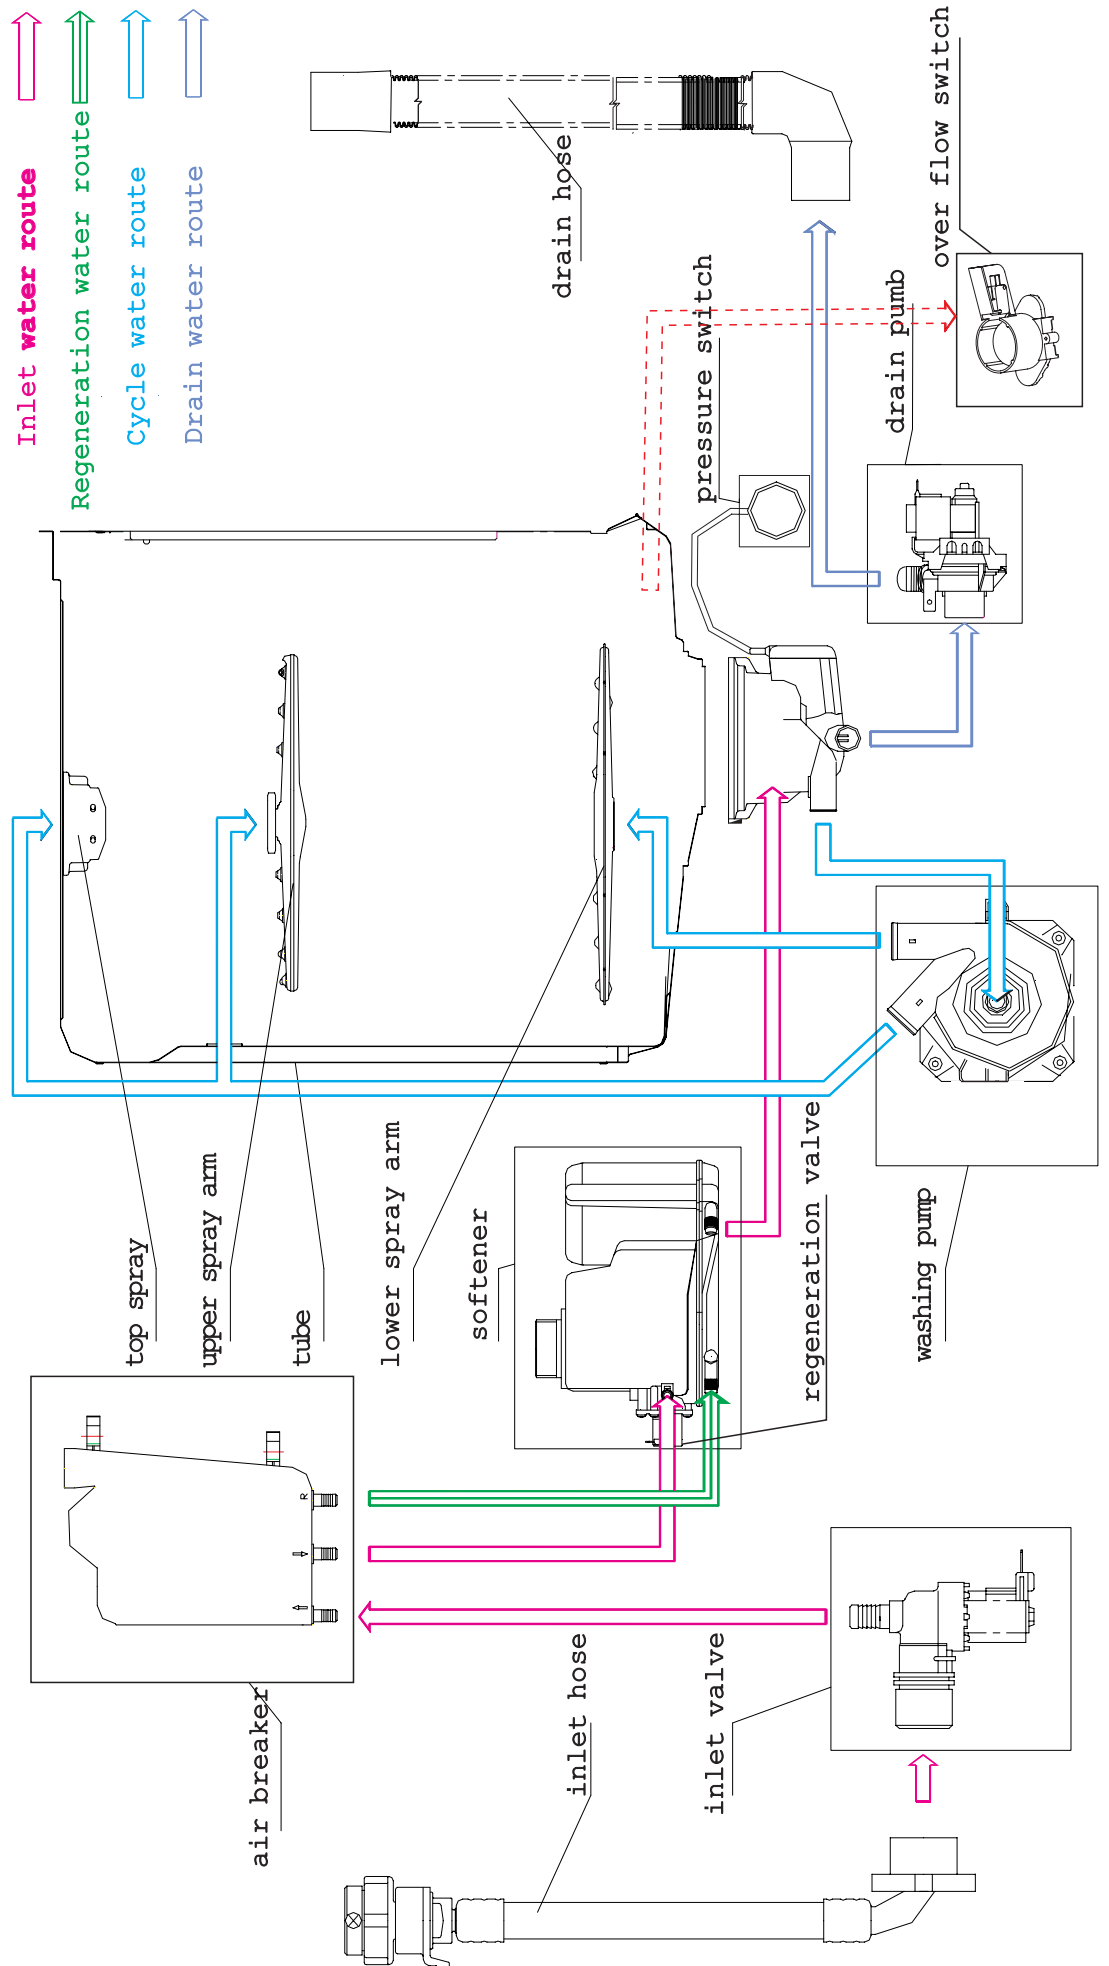

Models:WQP12-9338B WQP8-9337B

Electrical supply	220-240V, 50Hz
Supply water pressure	0.04MPa-1.0MPa
Supply water temperature	below 60°C

For the basic operation instructions, please refer to the instruction manual attached with each unit.

Water circuit scheme

Process of water inlet (indicated by magenta route)

In this process, regeneration water route is cut off, main water route is open. The water in the main water route is softened when pass through the softener, and then enter in the tub. During this phase, some of inlet water will be stored in the air breaker to be regenerating water.

Process of cycle washing (indicated by blue route)

Cycle washing action is driven by washing pump motor. Water can obtain the power during it passing through the working washing pump, then be pumped into spray arm, pass from spray arm nozzles, over the dishes, into sump ,where connect to washing pump, and to get in the next water cycle.

Process of regeneration (indicated by green route)

Regeneration valve is open, the regenerating water dissolve salt in the salt chamber of softener, and then enter in the resin tank to reactivate the resin.

Please Note: Exploded view and part list of each model have some different visions, so please refer to newest vision Midea sent you.

PCB

Printed Circuit Board is the control center of dishwasher, which receive and process signal from components, send order to components and deal with the feedback information, etc.

Access PCB

Removing the control panel

The control panel can be removed from dishwasher door.

1. Remove the six screws securing the control panel to the door.
2. The control panel will drop down and be free of the door. But, the wiring will still connected to the control panel.

Note: For the majority of models, the PCB is located behind the control panel. The minority of models locate the PCB on the side of strengthening muscle. You can judge the location by the newest exploded view Midea sent you.

3. Disconnect the connector form PCB.
4. Remove the screws securing the PCB to control panel.
5. Remove the PCB.
6. Reverse the above procedure to install.

Map of PCB

Note: This map is applies to 9346C model.

Description

Mark	Function
HEAT	Output for Heating Element
ACL	Input of live wire
ACN	Input of bull line
IS	Input of Door Switch
EV1-L	Firewire input of inlet valve
RE	Thermister
ML	Washing Pump
PS	Drain Pump
D/ED	Dispenser
EV1	Inlet valve
EV2	Softener
EV3	Halfload Valve
ISS	Salt detect
ISB	Rinse detect
IAQS	Overflow detect
FM	Flowmeter
FAN	Fan
PO	Pressure Switch(83/63)

There is small pole's location difference between different models. But the marks on PCB have the same meaning described on the left side.

Location of inlet valve

Appearance

The work principle

The inlet valve is electromagnetic valve that decide whether water enter or not. Valves are normally closed. Each time the appliance requires water, the controller will convey an electric signal to the coils to open the valves.

The inlet valve consist of electric coil, valve body, valve pole, filter etc.

In a word, the electromagnetic valve can act to allow water enter into machine, when it receive the order given by controller.

The defeat point

1. The valve coil is broken, so the valve can't open. It will cause the E1 error.
2. The filter is jammed, so water can't enter. It will cause the E1 error.
3. The connector is loose, so the valve can't open. It will cause the E1 error.
4. The valve pole is rusted or locked by dreg, so the valve can't open or close. It will cause the E1 or E4 error.

Technical data

Nominal voltage	220-240VAC
Frequency	50/60Hz
Resistance	Approx:3.4 - 4.3kΩ
Work duty	100%ED T25 3min/5min T60
Flux	4L/min 15%
Power	6W
Work Pressure	0.04 - 1MPa

Access inlet valve

1. Disconnect power.
2. Remove the water inlet hose. (Note : Be careful of remain water drop.)
3. Remove the baseboard, left baseboard, top panel, left side panel and middle rear crosspiece.

4. Disconnect the 2 terminal lugs from the inlet valve.
5. Push the valve from the lower rear crosspiece to take it off.
6. Remove the clamp and disconnect the inlet hose (to air breaker) from the water valve.
7. Reverse the above procedure to install.

Attention: Build in models have no Baseboard and left and right baseboard, but adjustable baseboard.

Inspect inlet valve

Check electric part

1. Open the control panel and take out the PCB;
2. Unplug the CON3 and P4 wires , then use the multi-meter Ω shelf to measure resistance between the blue wire (EV1) and white wire (IS), the normal resistance is about 3.4K Ω to 4.3K Ω .
3. If the measured resistance is not correct, it means the valve coil is broken or the connector is loose. In this case, we should check the connection first. If the problem hasn't been solved by re-connection, we should replace the valve..
4. If the resistance is OK, we need to inspect the valve body.

↓ unplug

Check machine part

1. If the electric part is OK, we need to check the machine part.
2. Remove the baseboard, left baseboard, top panel, left side panel and middle rear crosspiece.
3. Check the valve filter. if the valve filter is blocked, we need clear the residues.
4. If the valve filter is clear and the valve can't inlet water, check whether valve can act or not. If it isn't , we need replace the valve.
5. If the water is continue entering, we need replace the valve.

Location of Drain Pump

Bottom View

The work principle

Drain pump integrated into sump

The work principle

Drain pump consists of electrical motor, impeller, inlet and outlet.

Drain pump is a kind of pump driven by permanent magnet synchronous motor. The rotor is made with permanent magnet material, the running inertia of rotor is very small, the stator consist of silicon steel stack and coil. When the drain pump is on power, the rotor will be very easy to start.

The defeat point

1. The motor coil is broken, so the drain pump can't work. It will cause the E2 , E4 or E1 error .
2. The magnetism of motor rotor is weak, so drain pump cannot work. It will cause the E2, E4 or E1 error .
3. The connector is loose, so the drain pump can't work. It will cause the E2, E4 or E1 error .
4. The rotor is locked by residues, so the drain can't work . It will cause the E2, E4 or E1 error .
5. The drain pump assembly rack is loose, it will cause noise.
6. The non-return valve is bad, the remain water is too much.

Explanatory notes: failure of drain pump may cause E1, becaus

Technical data

Nominal voltage	220-240VAC
Frequency	50Hz
Resistance	150 - 220Ω
Delivery height	1M
Delivery performance	≥17l/min(230VAC)

Access drain pump

1. Drain off the water in the dishwasher, and disconnect the power supply.
(Note : Make sure to remove remained water in the dishwasher. If not, wet the floor.)
2. Remove four screws on bottom, and then remove bottom board.
3. Label and disconnect the two terminal lugs from the drain pump.
4. Remove screws securing the drain pump to sump, then remove drain pump.
5. Reverse the above procedure to install.

Inspect drain pump

Check the electric part

1. Open the control panel and take out the PCB;
2. Unplug the CON4 and P4 wires, then use the multi-meter Ω shelf to measure the red wire (PS) and white wire (IS), the normal resistance is about 150Ω to 220Ω .
3. If the measured resistance is not correct, it means the pump coil is broken or connector is loose. In this case, we should check the connection first. If the problem hasn't been solved by re-connection, we should replace the drain pump.
4. If the resistance is OK, but it also can't work, maybe the magnetism is too weak, so we need to replace the drain pump.

Check the machine part

1. If the electric part is OK, we need to check the machine part.
2. Remove bottom board.
3. If the non-return valve is wrongly assembled, the tub will remain much water. We need to re-assemble the non-return valve.
4. If the drain pump is working, but no water drain out or just a little. We should check the drain hose or drain body.

Location of Heater

The work principle

Technical data

Nominal voltage	230VAC
Rating power	1800W
Resistance	29.265 1.463Ω
Thermastat 1	98°C
Thermastat 2	229 °C

The defeat point

1. The heater coil is broken, so the heater cannot work. It will cause the E3 error.
2. The thermostat is active, so the heater cannot work. It will cause the E3 error.
3. The connector is loose, so the heater cannot work. It will cause the E3 error.

Access heater

1. Drain off the water in the dishwasher, and disconnect the power supply.
(Note : Make sure to remove remained water in the dishwasher. If not, wet the floor)
 2. Remove bottom board.
 3. Label and disconnect the terminals to and ground wire.
 4. Remove the 2 clamps from the Heating element.
- Caution: The clamp is easily damaged during removal and can't be reused. Replace the old clamp with a new universal clamp .
5. Reverse the above procedure to install.

Inspect heater

1. Remove bottom board.
2. Use the multi-meter Ω shelf to measure resistance between the two terminals shown in right picture, the resistance is about 29Ω to 31Ω .
3. If the measured resistance is not correct, it means the heater coil or the thermostat is broken, we should replace the heating element or the thermostat.

Location of Washing Pump

The work principle

Washing pump is a kind of asynchronism motor with capacitor. The stator consist of silicon steel stack and two coils, main coil and assistant coil .

The defeat point

1. The motor coil is broken, so the wash pump can't work. It will cause E3 error.
2. The motor rotor capacitor is weakened, so washing pump can't start. In this case, it will send out the electromagnetism noise. If it is continue electrifying motor, the thermal protector will work. It will cause E3 error.
3. The connector is loose, the wash pump can't work. It will cause E3 error.
4. The rotor is locked by residues, so the wash pump can't work . It will cause the E3 error.
5. The drain pump assembly bracket is loose, it will cause noise.
6. If the machine hasn't been used for long time, there is a possibility the wash pump can't starting.

Technical data

Models	YXW65-2B	YXW50-2
Nominal voltage	220-240VAC	220-240VAC
Frequency	50Hz	50Hz
Resistance	Main coil: 84.8 7%Ω	Main coil:93.10 7%Ω
	Assistant coil:78.6 7%Ω	Assistant:95.99 7%Ω
Delivery height	0.8m	1m(230VAC)
Delivery performance	≥50l/min(230VAC)	≥50l/min(230VAC)
Lock rotor current	≤1.50A	1.0 10%(230VAC)
Operating current	0.65A 10%	0.47 10%(230VAC)
Capacitor	5μF	3μF

Access Washing Pump

1. Disconnect power.
 2. Remove bottom board.
 3. Label and disconnect the 2 terminals to the capacitor.
 4. Label and disconnect the 2 terminals to the motor wire connector.
 5. Remove the clamp fastening the interconnect hose to the sump.
- Caution: The clamp is easily damaged during removal and can't be reused. Replace the old clamp with a new universal clamp (Dia-31.0mm)
6. Remove the clamp fastening interconnect hose to the lower nozzle .
 7. Remove the clamp fastening interconnect hose to heater.
 8. Remove the screw and disconnect the ground wire from the wash pump motor assembly.
- Note: Do not attempt to remove the bolt and locknut connecting the motor mount to the dishwasher frame.
9. Remove the motor pump assembly from the dishwasher.
 10. Reverse the above procedure to install.

Inspect Washing Pump

Check the electric part

1. Open the control panel and take out PCB;
2. Unplug the CON4 and P4 wires, then use the multi-meter Ω shelf to test resistance between two white wire (ML and IS), the normal resistance is about 78Ω to 100Ω .
3. If the resistance is not correct, it means the pump coil is broken or the connector is loose, In this case, we should check the connection first. If the problem hasn't been solved by re-connection, we would replace the washing pump.
4. If the resistance is OK but it cannot work, it maybe the capacitor weakly, we need to replace the capacitor.

Check the machine part

1. If the electric part is OK, we need to check the machine part.
2. Remove bottom board.
3. Check the pump assembly, if the bracket is loose, it will bring the noise, we need to tighten it.
4. If the wash pump cannot start and the machine hasn't been used too long, maybe the seal element is bond.
5. If the drain pump is working, but no water out or just a little. We should check the vane wheel.

The work principle

The pressure switch consists of a moving diaphragm and disc which activate a change over contact. The contact can be calibrated to trip and reset at the desired pressure levels, The main application is to control the level of water in appliances. May also provide flood protection.

In our production, the pressure switch is to control the water level in appliance, like 83/63 serial. May also provide flood protection, like 140/120 serial.

Manufacturer: Elbi

1 - COM

2 - NC

3 - NO

Front view

Back view

Location of NTC

Bottom View

The work principle

The work principle

Negative Temperature Coefficient Thermistor is integrated into sump, which is used for measuring temperature of water in the tub.

Access Washing Pump

1. Remove bottom board.
2. Remove two screws securing the NTC to sump (shown in above picture).
3. Take out NTC.
4. Reverse the above procedure to install.

Inspect NTC

1. Open the control panel and take out PCB;
2. Unplug the RE connector (shown in below picture), then use the multi-meter Ω shelf to test resistance between two blue wire, the normal resistance is shown in below table.
3. If the resistance is not correct, it means NTC circuit has a problem. In this case, we should check the connection first. If the problem hasn't been solved by re-connection, we would replace the NTC.

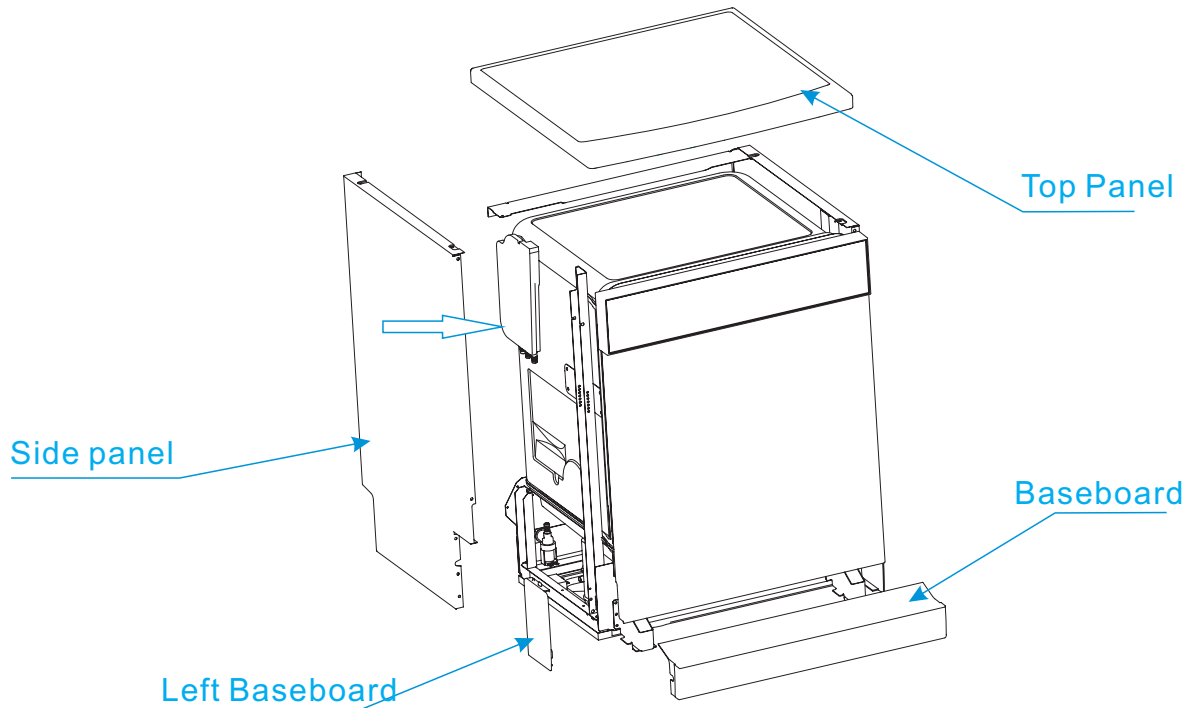

unplug

NTC resistance table

NTC	15°C	17.48K Ω
	20°C	12.12K Ω
	25°C	10K Ω
	30°C	8.299K Ω
	40°C	5.807K Ω
	50°C	4.144K Ω
	60°C	3.011K Ω
	70°C	2.224K Ω
	80°C	1.667K Ω
	85°C	1.451K Ω

Location of Flowmeter

Attention: Build in models have no Baseboard and left and right baseboard, but adjustable baseboard.

The work principle

Flowmeter is integrated into Air Breaker. Function of Flowmeter is measure how much water has entered in appliance. it consists of impeller, tongue tube and terminal, etc.

When water pass through the flowmeter, moving water can rotate magnetic impeller, the tongue tube can sense the impeller's magnetic and send electronic pulses.

Flowmeter

Access Flowmeter

1. Remove the baseboard, life baseboard, top panel and life side panel.
2. Remove the plastic nut inside tub, which secures the air breaker to tub. (Because flowmeter is integrated into air breaker, replace air breaker if flowmeter has failure.)
3. Disconnect the wire and remove clamp fastening hose to air breaker.
4. Take out air breaker.
5. Reverse the above procedure to install.

Inspect Flowmeter

1. Open the control panel and take out PCB;
2. Unplug the CON27 wire (shown in below picture), then use the multi-meter Diode shelf to test whether electrical pulse is sent out from two black wires while water is passing through flowmeter, or not.
3. If there is continual electrical pulse, the multi-meter will send out sound “de” continually.
4. If there is no electrical pulse, the multi-meter will not send sound. In this case, it means something wrong with flowmeter circuit. We should check the connection first. If the problem hasn't been solved by re-connection, we should replace the air breaker..

Location of Safety Hose

Electronic Aquastop Hose

Note: The assembly mode of mechanical Aquastop hose is the same as that of universal.

The work principle

Mechanical Aquastop Hose

Electronic Aquastop Hose

There are two types of Safety Hose, mechanical Aquastop hose and electronic Aquastop hose, which have different principles and assembly modes.

Mechanical Aquastop safety hose has two layers. If water leak and fill the air space between two layers, the foaming material will expand and lock the hose. In this situation, the machine might set off E1 alarm.

Electronic Aquastop safety hose also has two layers. But the difference from mechanical is that if the water leak and flow on the bottom tray, the flooding pressure switch on the tray will act, the electromagnetic valve on the hose will cut off the water road and the machine will set off E4 alarm.

Access Safety Hose

1. Remove baseboard, side baseboard, top panel and left side panel.
2. Remove clamp, cut the bound belt and disconnect the wire connector. Then the Inlet hose can be pulled out.
3. Reverse the above procedure to assemble.

Mechanical Aquastop Hose

Mechanical Aquastop hose is connected to appliance just as universal water inlet hose.

Inspect Safety Hose

Electronic Aquastop Hose

1. Open the control panel and take out the PCB;
2. Unplug the CON3 and P4 wires, then use the multi-meter Ω shelf to measure resistance between the blue wire (EV1) and white wire (IS). Open circuit and short circuit are both incorrect.
3. If the measured resistance is not correct, it means the valve coil is broken or the connector is loose. In this case, we should check the connection first. If the problem hasn't been solved by re-connection, we should replace the safety hose.

Mechanical Aquastop Hose

Maybe moisture absorption of foaming material in mechanical device cause a self-lock fault (can't fill the water) and this lock is non-resettable.

Test Program

In order to check the operation of components of appliance and find out the malfunction, we designed this program for technician.

How to activate Test Program

Test Program Operation	
	9338B 9337B
How to start Test Program	With door opened, Program + Power
Jump into next step	Program
E1	Rapid
E2	/
E3	1 Hour+Rapid
E4	Normal
E6	Normal+1 Hour
E7	Normal+1 Hour+Rapid

Take 9338B for example, with the door opened and machine off, hold down the Program button and press the POWER button until the machine enter into Test Program. The appliance will pause and stand by(as step 00). Then close the door to start the Test Program.

During test program running, you can press Program button to jump into next step (except inlet valve step).

Note: The way to activate test program is slightly different between different models.

Procedure of Test Program (for models controlling water filling by flowmeter)		
No.	Process	Description
0	Initialization	Power on, stand by
1	Inlet Valve	Open inlet valve and feeds with 3.6L water(45cm models feeds with 3.0L).
2	Washing Pump and Dispenser	Dispenser will act once and washing pump will run for 60s in this step.
3	Heating Element	Run washing pump and heating element until the water temperature reaches 57°C. Then the machine will pause. Press Program button to jump into the next step.
4	Drain Pump	Drain for 30s.
5	Pause	Pause for 10s.
6	Inlet Valve	Open inlet valve and feeds with 3.6L water(45cm models feeds with 3.0L).
7	Washing Pump	Run washing pump for 2 mins.
8	Half load valve	Run half load valve for 5s.
9	Washing pump and Half Load Valve	Run washing pump for 1 min.
10	Drain Pump and Regeneration Valve	Open regeneration valve and drain for 30s.
11	finish	Buzz one sound, stop, and stand by.

How to know which error code has occurred

To know which error code has occurred, refer to the previous table named Test Program Operation.

Take 9348 for example, If the error 1 has happened, the buzzer would alarm for 30 seconds and “E1” would be shown on display. Other error alarms would be shown in the same manner.

Take 9239D for example, if the error 7 has happened, the buzzer would alarm for 30 seconds and the Main, Rinse and Drying indicators would flash simultaneously. Other error alarms can be deduced from this.

	Main	Rinse	Drying	binary numeral	decimal numeral
error 1	0	0	1	001	1
error 2	0	1	0	010	2
error 3	0	1	1	011	3
error 4	1	0	0	100	4
error 6	1	1	0	110	6
error 7	1	1	1	111	7

The corresponding relation between indicator combination and error code shown in above figure.

Notice: the majority of models are follow this regulation, but some special models is different.

Attention

Priority level of E4 is the highest. E4 operation is valid after other error operations have done. When E4 operation has done, all the others are invalid.

In test program, E1, E3, E4, E6,E7 are valid.

How does the appliance react when error code occurred

E1 Water filling exceed pre-set time

For the models controlling water filling by flow meter.

If the inlet valve has been opened for 4 minutes but the water quantity hasn't reached the desired value(measure by pluses), E1 would occur.

When E1 occurs, the drain pump will run until flowmeter keep motionless for 2 minutes and all the other components will be stopped immediately. At the same time, the buzzer will alarm for 30 seconds and error 1 will be shown.

E3 Heating exceed pre-set time

If the heating element has been working for 60 minutes but the water temperature detected by NTC hasn't reached desired value. E3 would occur.

When E3 occurs, the drain pump will run until flowmeter keep motionless for 2 minutes (if the model with the pressure switch (83/63),drain pump would run till the pressure switch reset and continue draining for 60 seconds.) and all the other components will be stopped immediately. At the same time, the buzzer will alarm for 30 seconds and the error 3 will be shown.

E4 Overflow

At any time, if overflow micro-switch act and keep for longer than 2 seconds, the E4 would occur. When E4 occurs, the drain pump will run until flowmeter keep motionless for 2 minutes (if the model with the pressure switch (83/63),drain pump would run till the pressure switch reset and continue draining for 60 seconds.) and all the other components will be stopped immediately. At the same time, the buzzer will alarm for 30 seconds and error 4 will be shown.

Note: Priority level of E4 is the highest. E4 operation is valid after other error operations have done. When E4 operation has done, all the others are invalid.

E6 Open-circuit failure of thermistor

In test program, once open-circuit failure of thermistor is detected by controller, the E6 would occur. When E6 occurs, the drain pump will run until flowmeter keep motionless for 2 minutes (if the model with the pressure switch (83/63),drain pump would run till the pressure switch reset and continue draining for 60 seconds.) and all the other components will be stopped immediately. At the same time, the buzzer will alarm for 30 seconds and error 6 will be shown.

E7 Short-circuit failure of thermistor

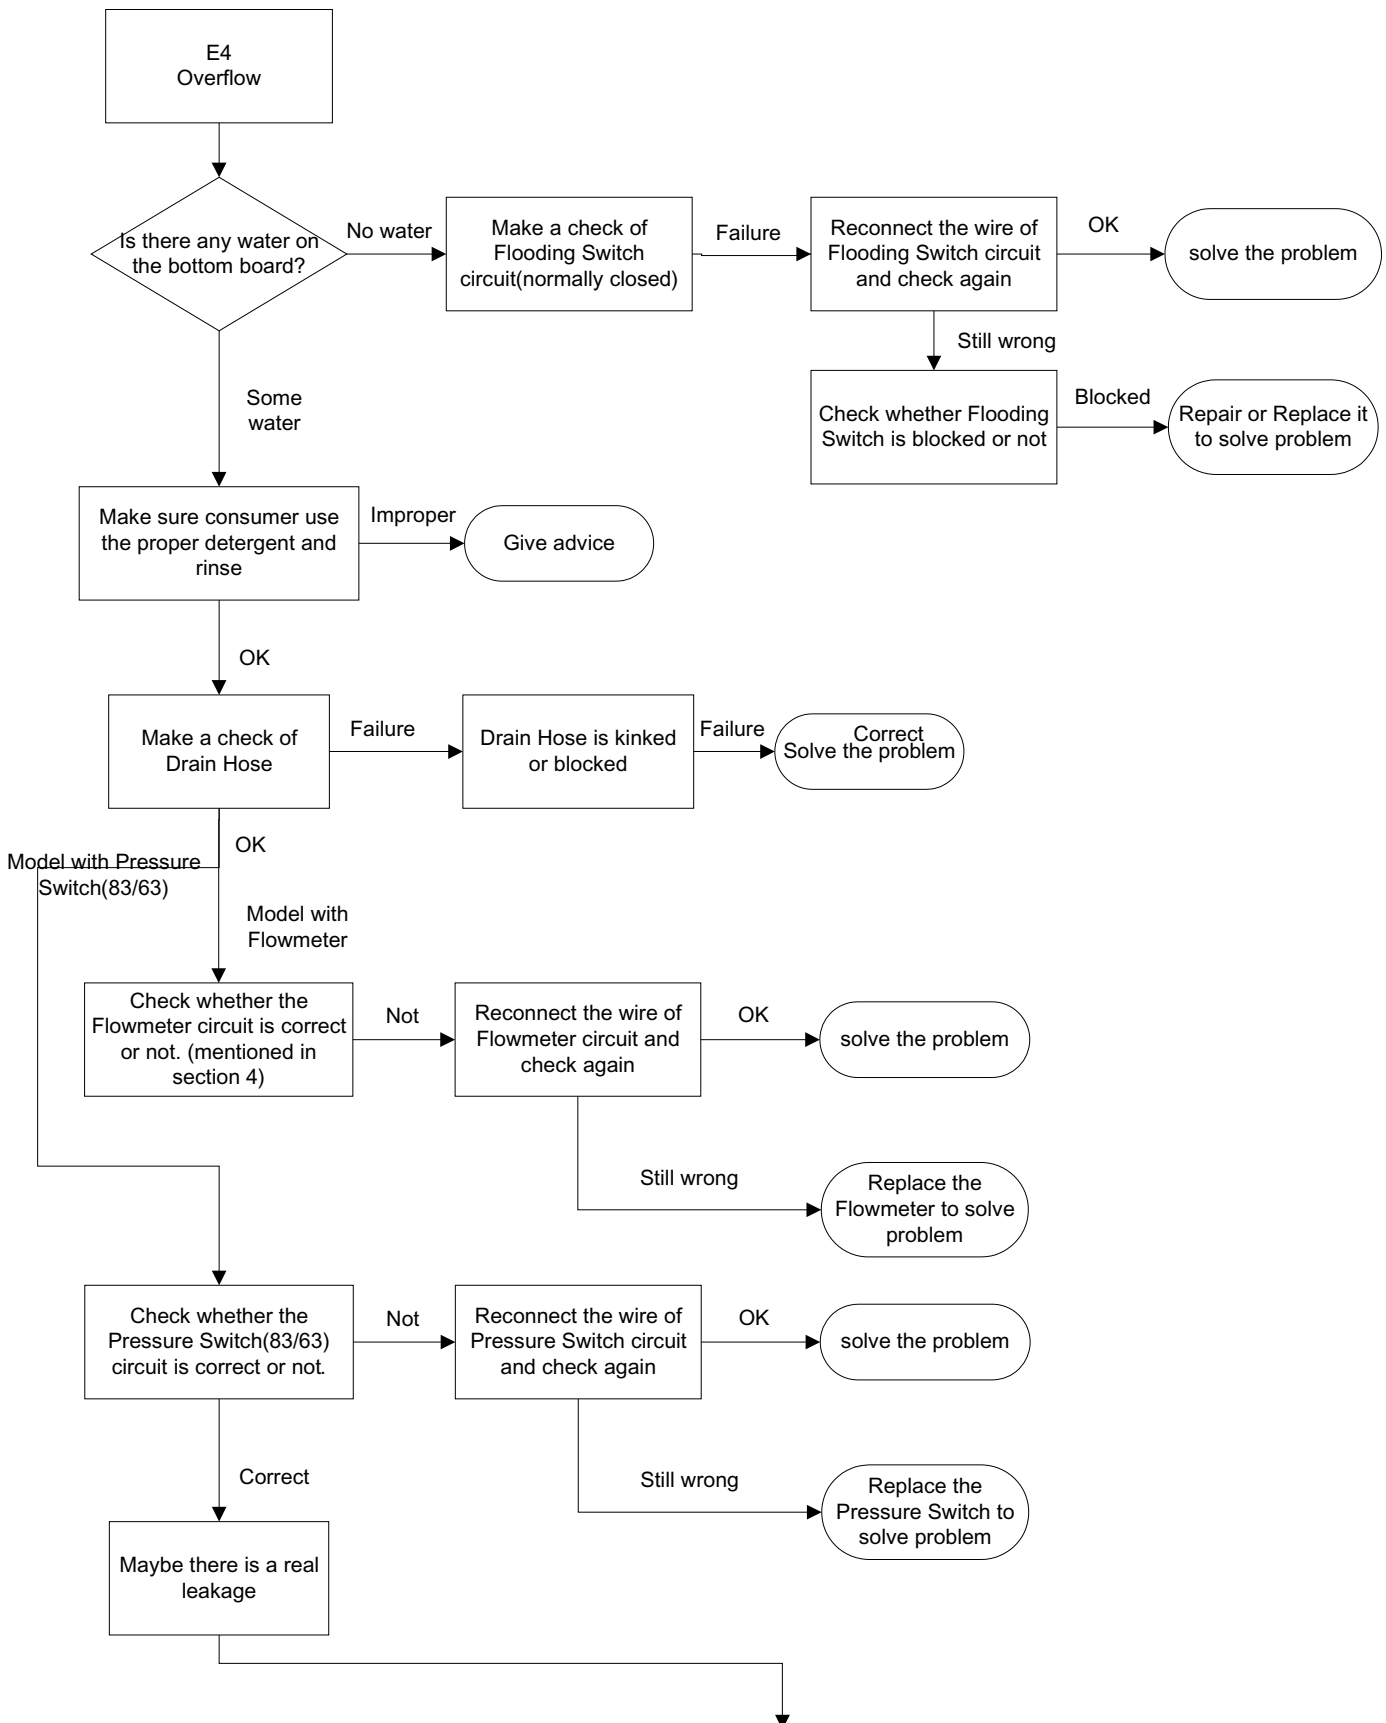

In test program, once short-circuit failure of thermistor is detected by controller, the E7 would occur. When E7 occurs, the drain pump will run until flowmeter keep motionless for 2 minutes (if the model with the pressure switch (83/63), drain pump would run till the pressure switch reset and continue draining for 60 seconds.) and all the other components will be stopped immediately. At the same time, the buzzer will alarm for 30 seconds and error 7 will be shown.

If the problem has not been solved through all the inspection mentioned above, maybe the PCB has a malfunction. So, replace PCB and test again.

E4 tree -> Inspection

Do as follows

Remove two side panels

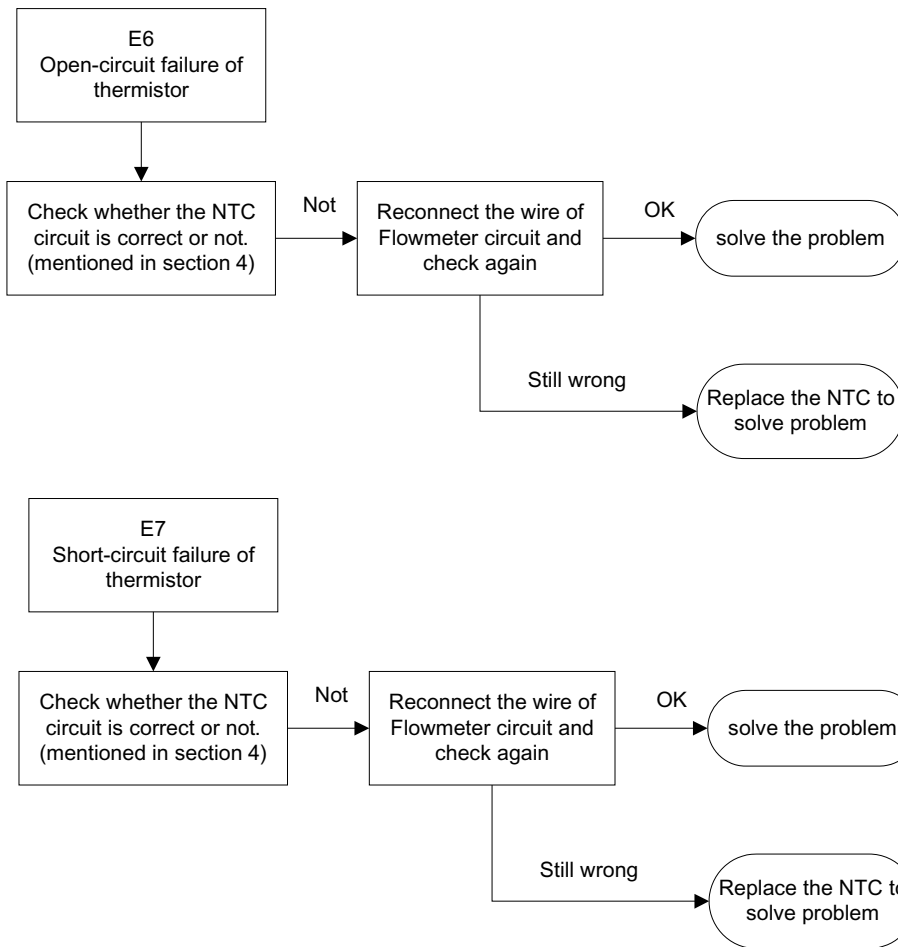

Remove the water from the bottom board and make sure there is no water at the bottom board.

Restart the dishwasher with a strong or standard wash program as a leakage could easily repeat at a higher temperature and after a long period of running time.

Observe the bottom tray every twenty minutes.

If any water appears, you will found out which areas, such as motor, drain pump, sump, softener, and hoses between them, and also clips at the end of each hose, besides the weld seam at the bottom of the tub.

If hours passed, but no water comes out, you should stop the dishwasher with sufficient water in the inner tub, and observe it again after leaving it alone for one to two hours.

If the problem has not been solved through all the inspection mentioned above, maybe the PCB has a malfunction. So, replace PCB and test again.

Caution:

Because the real situation is unpredictable, inspection trees mentioned in this manual are for reference only.

symptom	possible reason	analysis	operation	remedy
E1 longer inlet time	check the AQUA STOP hose	defective AQUA STOP hose might cut off the water inlet route	for mechanical AQUA STOP hose, check whether the mechanical device is lock or not for electronic AQUA STOP hose, check whether the valve circuit is ok or not	replace the hose reconnect or replace the hose
	check the water supply	the tap isn't open lower hydraulic pressure	check whether the tap open or not make sure the hydraulic pressure in the range from 0.04 to 1.0 Mpa	give advice give advice
	check the inlet	inlet hose is blocked or kinked	unblock or unkink	unblock or unkink
	check the inlet valve	loosing connection or defective inlet valve might cause the E1 alarm	check the circuit of inlet valve	reconnect or replace the valve
	check the flowmeter	for models with flowmeter, defective flowmeter might cause the E1 alarm	check the circuit of flowmeter	reconnect or replace flowmeter
	check the pressure switch (83/63)	for models controlling water filling by pressure switch, defective pressure switch might cause the E1 alarm	check the circuit of pressure switch	reconnect or replace the pressure switch
	check the drain	wrong installation of drain hose might cause water siphon out	make sure it is installed properly.(refer to instruction manual)	reinstall drain hose
	check the pressure switch (140/120)	defective pressure switch might cause the drain pump always run	listen the sound to check whether the drain pump is run or not	replace the pressure switch (140/120)
	check the PCB	defective PCB might cause the E1 alarm	When you have eliminated other possible causes, maybe there is something wrong with PCB	reconnect or replace PCB
	E2 longer drain time	check the drain hose	blocked hose	unblock the hose
check the drain pump		defective drain pump	check the circuit of drain pump	reconnect or replace the drain pump
check the pressure switch (83/63)		if there is no water in the tub and appliance still ste off E2 alarm, the possible reason is defective pressure switch	check the circuit of pressure switch	reconnect or replace the pressure switch

				When you have eliminated other possible causes, maybe there is something wrong with PCB	reconnect or replace PCB	
				Advice: Even though a dishwasher is constantly being pounded with water and soap, it needs an occasional cleaning. Food particles, hard water deposits, mildew, mold and bacteria can and do build up along the surfaces and in the crevices of a dishwasher. Cleaning a dishwasher regularly will keep it functioning properly, keep your family healthy and safe, and keep your dishes coming out sparkling and make sure the hydraulic pressure in the range from 0.04 to 1.0 Mpa.	clean the filter and give advice	
				low hydraulic pressure might cause the less filling water	give advice	
				wrong installation of drain hose might cause water siphon out	reinstall drain hose	
				washing pump doesn't running might cause E3 alarm	replace the washing pump	
				measure the capacitance of starting capacitor. Capacitor attenuation could cause the motor can't start	replace the capacitor	
				measure temperature of water in tub continuously when test program is running to see whether temperature increasing (approximate 2 °C/min) is normal and the appliance pause when the water temperature reach 60 degree or not.	replace the defective component	
				if haven't find the problem after checking the components mentioned above, it is most possible reason that anti-drying pressure switch is abnormal.	replace the anti-drying pressure switch	
				So, When you have eliminated other possible causes, you can try to change PCB to see if the problem be solved.	reconnect or replace PCB	
				give advice to end customer advice on use the amount of detergent used during the wash cycle according to instruction manual	give advice	
				defective PCB might cause E2 alarm		
				severely jammed filter might cause E3 alarm, so give advice to end customer on clean regularly the interior of dishwasher.		
				low hydraulic pressure might cause the less filling water		
				wrong installation of drain hose might cause water siphon out		
				washing pump doesn't running might cause E3 alarm		
				malfunction of heater or NTC might cause E3 alarm		
				abnormal anti-drying pressure switch might cause E3 alarm		
				defective PCB also might cause E3 alarm, but its probability is small.		
				too much detergent used during the wash cycle could cause the water foams up and overflow on the bottom		
				check the use of detergent		
E3	heating fault	check the PCB	check the heater and NTC	check the drain hose	check the anti-drying pressure switch	check PCB

	check whether the appliance is level	if appliance is not level, it might cause the E4 alarm	make sure the appliance is level	level appliance
E4 overflow	check the drain pump	defective drain pump might cause the E4 alarm	the first step of all the washing program is drain, which could be used to test whether drain pump work normally or not	replace the drain pump
	check the amount of filling water	too much filling water could make a overflow	for models controlling water filling by pressure switch(83/63), run test program and check whether the amount of filling water is normal or not.	repalce the pressure switch(83/63)
	check the float microswitch	sticking float microswitch could cause the E4 alarm	for models controlling water filling by flowmeter, run test program and check whether the amount of filling water is	replace the flowmeter
	find where leakage is	if there is a real leakage, finding where leakage is and solving the problem would be	disassemble the bottom tray and check whether the float microswitch moves freely up and down	repair or replace the float microswitch
			to find and solve problem, do as suggestion mentioned in service manual	repair or replace the defective component
